FULLERENE COMPOUNDS

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the benefit of U.S. Provisional Application No.: 60/396,782, filed July 17, 2002. The contents of this applications is hereby incorporated herein by reference in its entirety.

BACKGROUND OF THE INVENTION

Free radicals have been shown to inhibit tumor growth by causing oxidative damage to lipids, proteins, and nucleic acids of the tumor cells. In clinical practice, a photo-sensitizer is first delivered to a tumor site and then activated by irradiation to generate free radicals, thus inhibiting tumor growth. Fullerenes are conjugated olefins of a closed cage structure. When photo-excited, they are capable of transforming molecular oxygen into singlet oxygen and then the related free radicals, such as superoxide free radicals, i.e., $O_2^{\cdot-}$. Thus, fullerenes may be used to treat tumors.

15 described below. All publications, patent applications, patents, and other references mentioned herein are incorporated by reference in their entirety. DETAILED DESCRIPTION OF THE INVENTION

The compounds of this invention can be synthesized by methods known in the art. Scheme 1 below shows the syntheiss of a compound of this invention:

Scheme 1 Reagents and conditions: i, iodoethane, NaOH, tetrabutylamino bromide, toluene, 60 °C, 8 h; ii, diphenylamine (1.0 equiv.), tris(dibenzylideneacetone)dipalladium(0) (cat.), *rac*-BINAP, sodium *t*-butoxide, toluene, 110 °C, 8 h; iii, bromoacetyl bromide, AlCl₃, CH₂CH₂, 0 °C to *r.t.*, 4 h; iv, C₆₀, 1,8-diazabicyclo[5.4.0]undec-7-ene, toluene, room temperature, 5 h.

Referring to Scheme 1 above, 2-bromofluorene **1** is used to prepare a diethyl-2-diphenylaminofluorene **2**, which is then reacted, under catalytic condensation conditions, with an amino (e.g., diphenylamine) to obtain an amino-substituted diethyl-2-diphenylaminofluorene **3**. Friedel-Crafts condensation of **3** with a mixture of bromoacetyl bromide and aluminum chloride in 1,2-dichloroethane gives a bromoacetyl amino-substituted fluorene compound **4**. The reaction of a fullerene compound with **4** in toluene gives a desired compound of this invention.

Referring to formula (I), additional substituents (when *n* is greater than 1) can be introduced by using a greater amount of compound **4**. The fullerene compounds of this invention in which *W* is C(CN)₂, N⁺Y₁Y₂, aryl, or heteroaryl can be prepared by reacting the compound (or other compounds having a carbonyl group, i.e., in which *W* is O) with reagents such as dicyanomethane, substituted hydrazine or amine; or by using reagents containing aryl (e.g., phenyl) or heteroaryl (e.g., pyridynyl) as *W*, instead of bromoacetyl bromide. See, e.g., March, *Advanced Organic Chemistry (Reactions, Mechanisms, and Structure)*, 4th Edition, John, Wiley & Sons, New York, 1992. The fullerene compounds of this invention in which *r* is 1 can be prepared by coupling compound **3** with dihalogenated aryl or heteroaryl, and then subjecting the product of the coupling reaction to the Friedel-Crafts condensation shown in Scheme 1. Substituents on a fullerene core, such as various *R* and *E* shown above, can be introduced by methods described in U.S. Patent Nos. 6,020,523, 6,046,361, and 6,380,434. Different X₁, X₂, X₃, X₄, X₅, Y₁, and Y₂ can be introduced by using starting materials that are pre-substituted with desired groups (e.g., each of X₁, X₂, X₃, and X₄, independently, is methyl; and X₅ is chloro).

A compound of this invention or its salt in a sufficient amount is formulated with a pharmaceutically acceptable carrier to form a pharmaceutical composition before being administered to a subject in need of treatment of a tumor. "A sufficient amount" refers to the amount of the compound which is required to confer therapeutic effect on the treated subject. The interrelationship of dosages for animals and humans (based on milligrams per meter squared of body surface) is described by Freireich et al., Cancer Chemother. Rep., 1966, 50, 219. Body surface area may be approximately determined from height and weight of the patient. See, e.g., Scientific Tables, Geigy Pharmaceuticals, Ardley, N.Y., 1970, 537. Effective doses will also vary, as recognized by those skilled in the art, depending on the route of administration, the excipient usage, the distance of tumor from the skin surface, the source of the irradiation, and the optional co-usage with other therapeutic treatments including use of other anti-tumor compounds.

The pharmaceutical composition may be administered via a parenteral route, e.g., topically, intraperitoneally, and intravenously. Examples of parenteral dosage forms include an active compound dissolved in phosphate buffer solution (PBS), or admixed with any other pharmaceutically acceptable carrier. Solubilizing agents, such as cyclodextrins, or other solubilizing agents well known to those familiar with the art, can also be included in the pharmaceutical composition.

An *in vitro* inhibition assay can be used to preliminarily evaluate a fullerene compound's ability to inhibit the growth of tumor cells. For example, a fullerene compound solution can be added to a pre-incubated cell suspension. Subsequently, the cell suspension is irradiated with fluorescence light, followed by further incubation. A solution of 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl-tetrazolium bromide is added to the cell suspension to react with mitochondrial dehydrogenase to form formazon, which is extracted with dimethyl sulfoxide (DMSO). The DMSO extract is immediately used for optical measurement to determine the quantity of formazon, which correlates with the quantity of dehydrogenase or the relative number of the living cells.

The fullerene compounds that have been preliminarily evaluated can be further tested to confirm their efficacy by an *in vivo* inhibition assay. See Chiang, et al., *Proc. Electrochem. Soc.*, 1999, 99-12, 238-249, and U.S. Application Series No. 09/666,989. For example, a tumor-bearing mouse can be first administered a suitable fullerene compound in PBS close to the tumor site. The mouse is then kept in the dark while the fullerene compound is circulated to the tumor site. After

the hair on and around the tumor site is removed, the tumor site is irradiated with a laser beam or other light source. After the irradiation, the growth of the tumor in the mouse is examined at different intervals. The inhibitory effect is evaluated by measuring the mouse's average body weight and tumor volume. The mouse is euthanatized by carbon dioxide asphyxiation. The final
5 body weight and organ weight of the treated mouse are measured. Blood samples are withdrawn for biochemistry and hematology analyses. All such data can be used to evaluate the efficacy of the fullerene compound to treat tumor.

Without further elaboration, it is believed that one skilled in the art, based on the description herein, can utilize the present invention to its fullest extent. The following
10 specific examples, which describe synthesis and biological testing of several compounds of this present invention, are therefore to be construed as merely illustrative, and not limitative of the remainder of the disclosure in any way whatsoever.

Example 1:

Synthesis of 2-bromo-9,9-diethylfluorene

15

To a solution of 2-bromofluorene (2.5 g, 10 mmol) in toluene (40 ml) was added tetrabutylammonium bromide (0.8 g, 2.48 mmol) as a phase transfer catalyst. A freshly prepared solution of aqueous sodium hydroxide (25 ml, 50% w/w) was added at once to the solution. The mixture turned orange and became viscous. To this solution, iodoethane (2.4 ml, 30 mmol) was
20 added. The mixture was stirred at 60 °C for a period of 8 h. It was diluted with ethyl acetate (25 ml) and washed several portions of water. Organic layer was dried over magnesium sulfate and concentrated in vacuo to afford the crude product liquid. The products were purified by column chromatography (silica gel, hexane as eluent, R_f = 0.8 on thin layer chromatography) giving colorless oil of 2-bromo-9,9-diethylfluorene (2.5 g) in a yield of 82%.

25 ^1H NMR (CDCl_3) δ 0.24 (t, J = 8 Hz, 6H), 1.94-1.91 (m, 4H), 7.25-7.23 (m, 3H), 7.38-7.36 (m, 2H), 7.49-7.46 (m, 1H), and 7.61-7.59 (m, 1H).

Example 2:

Synthesis of 9,9-diethyl-2-diphenylaminofluorene

30

A mixture of 2-bromo-9,9-diethylfluorene (2.44 g, 8.10 mmol), diphenylamine (1.43 g, 8.5 mmol), tris(dibenzylideneacetone)dipalladium (0.018 g, 0.25 mmol%), *rac*-BINAP (0.037 g, 0.75

mmol%), and sodium *t*-butoxide (1.08 g, 11.34 mmol) in dry toluene (100 ml) was heated at the refluxing temperature of the solvent for 8–10 h under an atmospheric pressure of nitrogen. After cooling the reaction mixture to room temperature, it was diluted with diethylether (60 ml), washed with brine (40 ml) and water. Organic layer was dried over sodium sulfate and concentrated in vacuo. The crude product was purified by column chromatography (silica gel, hexane–toluene/9:1 as eluent, $R_f = 0.6$ on thin layer chromatography using hexane–toluene/4:1 as eluent) to give 9,9-diethyl-2-diphenylaminofluorene (3.1 g) as a white amorphous low melting solid in a yield of 98%.

^1H NMR (CDCl_3) δ 0.36 (t, $J = 7.3$ Hz, 6H), 1.99–1.87 (m, 4H), 7.06–6.99 (m, 3H), 7.15–7.12 (m, 5H), 7.33–7.23 (m, 7H), and 7.64–7.57 (m, 2H).

Example 3:

Synthesis of 7-bromoacetyl-9,9-diethyl-2-diphenylaminofluorene

To a suspension of aluminium chloride (0.375 g, 2.82 mmol) in 1,2-dichloroethane (15 ml) at 0 °C was added a solution of 2-diphenylamino-9,9-diethylfluorene (1.0 g, 2.57 mmol) in 1,2-dichloroethane (15 ml). Bromoacetyl bromide (0.269 ml, 3.08 mmol) was added over a period of 10 min to maintain a steady reaction temperature between 0–10 °C under an ice-bath. At the end of addition, the mixture was warmed to ambient temperature, stirred for another 4 h, and quenched by a slow addition of water (50 ml) to maintain the mixture temperature below 45 °C. Organic layer was washed subsequently with dil. HCl (1.0 N, 50 ml) and water (50 ml, twice). It was concentrated in vacuo to give crystalline yellow solids. These crude products were purified by column chromatography (silica gel, hexane–toluene/3:2 as eluent, $R_f = 0.3$ on thin layer chromatography using the same solvent mixture as eluent) to afford 7-bromoacetyl-9,9-diethyl-2-diphenylaminofluorene (0.87 g) as yellow crystalline solids in a yield of 66%.

Singlet oxygen production by 7-(1,2-dihydro-1,2-methano[60]fullerene-61-(1,1-dicyanoethylene))-9,9-diethyl-2-diphenylaminofluorene upon laser irradiation

Direct measurement of singlet oxygen was carried out by the detection of its luminescence emission at 1270 nm corresponding to ¹ Δ_g to ³ Σ_g transitions of molecular oxygen. The measurement was accomplished using a highly sensitive photon multiplier tube (PMT) detector coupled with 4 bandpass filters (1200, 1270, 1300, and 1330 nm) and monitored in the near infrared region. The PMT output was amplified and converted to a voltage pulse using a high-speed current preamplifier. A multichannel scaler connected to a personal computer was used for time-resolved single photon counting, with a typical temporal resolution of 80 ns. A photosensitizer sample solution of 7-(1,2-dihydro-1,2-methano[60]fullerene-61-(1,1-dicyanoethylene))-9,9-diethyl-2-diphenylaminofluorene (0.1 mg/ml, DMF) in a quartz cuvette was irradiated by a tunable pulsed laser system with the excitation wavelength of 532 nm and the

irradiation spot size of 3 mm in diameter. The pulse energy (630 nm) applied to the sample is roughly 1.0 mJ and the photoemission at 1,270 nm was detected and counted in intensity as the sum of photon emission over 1,000-65,000 laser pulse records. A time-resolved signal measurement, with a laser pulse length of 20 nsec and duration of 0.1 sec between each pulse, was
5 utilized to follow the decay of $^1\text{O}_2$ over a time period of 40 μsec . An unexpectedly large amount of singlet oxygen and oxygenated radicals generated from fullerene derivatives or composites were observed.

In vitro studies were conducted by methods described in the literature to assess the direct or indirect oxidative damage of biomolecules, including selective DNA cleavage (see Boutorine et
10 al., *Angew. Chem. Int. Ed. Engl.* 1994, 33, 2462-2464; and Irie et al., *Biosci. Biotech. Biochem.* 1996, 60, 1359-1361.), and membrane lipid peroxidation (see Sera et al., *Carcinogenesis* 1996, 17, 2163-2169). *In vivo* studies were also conducted to assess the antitumoral activity by methods described in Yasuhiko et al., *Jpn. J. Cancer Res.* 1997, 88, 1108-1116; and Chi et al., *Proc. Electrochem. Soc.* 1999, 99-12, 234-249. The results show that the tested fullrene compound was
15 unexpectedly effective in inhibiting the growth of tumor cells.
